Abstract: *The purpose of this research is to make a radiography on the number of enterprises at the Romania, which can represent a first step regarding the entrepreneurial development of the rural and practical environment, the increase of the number of companies in this area. In this sense, based on the data obtained from the National Trade Register Office, both a differentiation between urban and rural areas was made, as well as a classification of the type of enterprise existing at the level of Romania. All these have the role of identifying the difference between the two living environments, but also of observing a statistical evolution at national level regarding the development of each region separately. It was found that micro-enterprises have register the highest number regarding the type of enterprise existing on the Romanian territory. The reported value of these types of legal entities is 2-3 times higher in the urban area, compared to the rural area. Moreover, large enterprises have been found to be specific to the urban environment, as in the rural area there are registered in some regions of the country's development even a 10% percentage compared to the urban area.*

Key words: *enterprise; urban area; rural area; entrepreneur; economy*
